

INTERNAL GUIDELINE

Time & Mileage Workflow

How the Qleno clock, drive, and pay model works — and how it improves on MaidCentral by removing the confusion.

ONE CLOCK, AT THE HOUSE

AUTOMATIC MILEAGE

CAPTURE ≠ PAY

Reading the My Jobs screen

This is what a cleaner sees for each job. Every element maps to a decision — here is what each one does.

- 1 **Status + Price.** The job state and price. **Change price** lets the cleaner adjust with office permission (e.g. an add-on).
- 2 **Client & service.** Who, what service, scheduled time, and the address (tap to navigate).
- 3 **"8.0 mi away."** Live distance from the cleaner's phone to the job — orientation only. This is NOT the reimbursed mileage; that is computed job-to-job by the engine.
- 4 **Add note + Before/After photos.** Job documentation — proof of work and any issues.
- 5 **On My Way.** The departure tap. Sends the client an ETA text from GPS *and* records the drive leg from the previous job (the mileage hook).
- 6 **Clock In.** The check-in at the house — starts this job's time. (Clock Out appears when done.)

Notice what's missing: no "Mileage" button (retired — it's automatic now) and no separate "start my day" clock. The day is figured out from the clocks themselves.

The whole day — three taps per house

One simple loop repeats at each home. There is no day clock to remember.

- 1 **On My Way** — when leaving for the house. Texts the client a live ETA and starts the drive leg (job A → job B).
- 2 **Clock In** — on arrival. Starts this job's time, with GPS to confirm they're on-site.
- 3 **Clock Out** — when the house is done. Stamps the actual job time. Then drive to the next house and repeat.

The day is derived, never a button. "Paid day" = first Clock In → last Clock Out. Checking out of the *last* house ends the day automatically — because there's no more activity, not because a button was pressed. A surprise add-on just extends it. This is also what guarantees the drive home is never paid.

What the cleaner sees when the last house is done

This is a **closure state, not a tap** — it appears on its own once every job is checked out. It gives the cleaner a clear "I'm finished" moment plus their day at a glance, without a clock-out button to forget.

"Start another job" is available only if a late add-on comes in — which simply extends the day.

SHIPPED This card is live in the mobile app today.

MaidCentral vs. Qleno

Same rigor — half the friction, none of the "why is this on here?"

AREA	MAIDCENTRAL	QLENO
Taps per house	Day Clock In/Out <i>and</i> per-job Check In/Out — two button pairs the tech mixes up	One pair, at the house. Day is derived. One fewer tap.
Drive time on payroll	Auto-adds a paid "Drive & Office Hours" line — confusing for a commission shop	Drive hours are a record, never an auto-pay line. Pay = commission + mileage only.
Mileage entry	Captured, but bundled with auto drive-pay	Automatic from the job sequence. No form. Route-proof point-to-point distance.
"Efficiency"	Three different formulas all called "Efficiency"	One number, one name: Allowed ÷ Actual Job Hours.
Payroll screen	Hours-first; the drive-pay line draws the eye	Dollars-first: Commission + Mileage = Total. Hours shown as a record.
Compliance	Captured	Same record — plus a quiet flag only when a week crosses 40 hours.

Mileage — the rules, locked

- **Only the legs between jobs are paid.** House A → House B counts. Home → first job and last job → home are commute and are never reimbursed.
- **Distance is the mapping API's driving distance between the two client addresses** — not the cleaner's actual route. They cannot pad miles by driving around.
- **Dated rate table.** A past week computes at the rate that was in effect then, never today's rate.
- **No money until reviewed.** Computed mileage waits in a review gate; it only becomes pay when the office approves it. Every paid mile traces back to its leg.

Idle time, & "what if they milk it?"

The one rule that protects you both ways: capturing ≠ paying.

Qleno records every minute — job, drive, idle — for visibility and the rare overtime check. But the only dollars that move are **commission + mileage**. Idle is a number you see, not a line you pay.

Idle = on-the-clock time that wasn't in a house and wasn't reimbursed driving (usually a lunch break). It is a record, not pay. Real meal breaks are excluded; on-duty waiting only matters in a 40+ hour week.

Why milking the system earns nothing

WHAT THEY MIGHT TRY	WHY IT DOESN'T WORK
Dawdle inside a house	Pay is on commission / allowed hours — taking longer earns the same money in more time , lowering their effective rate and turning their efficiency score red .
Pad idle / linger between jobs	Idle isn't paid. Linger earns \$0 .
Take the long way for more miles	Mileage is fixed point-to-point distance — route-independent .
Fake their location	GPS at check-in/out + a geofence flag catches off-site punches.
Linger into overtime	No day clock to pad — the day auto-ends at the last check-out.

The captured idle / drive / efficiency data is the office's **coaching radar** — it tells you who to coach, not who to pay.

Where each timestamp goes

TIMESTAMP	FEEDS	DRIVES
Clock In/Out (per house)	Job hours, allowed-vs-actual, billing	Pay, pricing, coaching
On My Way	Client ETA text + drive leg	Customer experience + mileage
Drive legs (between jobs)	Mileage reimbursement; hours record	Reimbursement; OT check
GPS at punch	On-site verification + geofence flag	Accountability / disputes
Derived day	Total paid hours record	Overtime compliance

Bottom line. Qleno keeps MaidCentral's insight — separate meters for pay, job cost, and the drive/idle gap — but the cleaner only ever taps On My Way, Clock In, Clock Out. Everything else is derived, automatic, and milking-proof.
